ASSUMPTION (What we belive is true)	WHAT BREAKS IT? (Misalignment / Violation)	RESULTING BEHAVIOR (What actually happens)	IMPACT (Risk / Consequence)	
AWS services are trusted and can not be compromised	Attacker gains access to the service – through code injection, misconfigured permissions or exposed creds – and can now assume the role attached to it	Attacker uses the service's own role to access S3 – looks like legitimate traffic, no alarms raised	Access to everything the role permits – could be one bucket, could be all of S3, could be the whole account if the role is overly permissive	Major risk, significant damage HIGH
You need an AWS account to access a bucket	Bucket policy set to Principle "*" with no explicit DENY – Block Public Access off	Anyone on the internet can access the bucket – no creds, just a URL or AWS CLI with --no-sign-request	Access to everything in the bucket. No account needed, no sophistication required. Random attackers can stumble into it	Severe, likely catastrophic CRITICAL Depends on what is accessed
If the bucket policy is secure, all objects inside are secure to	Individual objects can have their own public ACL set – seperate from the bucket policy. Old objects from 2015–2019 may still have public read ACL that was never changed	Attacker accesses individual objects directly – bucket looks secure but old objects are still publicly readable	PII, creds, secrets exposed silently. Company thinks they're secure, but old objects are still publicly readable	Severe, likely catastrophic CRITICAL
The person or service using these creds is trusted and will only do what they are supposed to do	Creds gets compromise – leaked in code, exposed in enviornment variables, stolen via phishing – attacker now has everything those permissions allow	Attacker uses legitimate creds to GET, PUT, DELETE across every bucket the permissions cover looks completely normal no alarms raised	Every bucket the permissions cover is at risk – data exfiltration, destruction, or overwrite across the entire account	Major risk, significant damage HIGH
